

Get started

1. Right-click the downloaded CAM zip and choose **Extract All**. Open the new folder. Do not run CAM from inside the zip.
2. Double-click **Start CAM.vbs**. Your browser opens by itself; the first start can take a little longer.
3. Choose where your gradebook will live:
 - Click **Start fresh with sample data** to create it in `Documents\CAM Data`.
 - Or click **Browse...**, choose another local folder, then click **Use this folder**.

Keep the CAM app folder and your data folder separate. You can replace the app folder during an update without replacing your gradebook.

Set up a class

1. In the top bar, click **Add / Edit class** and choose **Add a class**.
2. Enter the class name. Add the grade, MYP year, and subject if you use them.
3. For a local workflow, use **Browse...** beside **Master directory** and select the folder that will hold this class's assignment folders.
4. Click **Create class**.
5. In Window 2, add students one at a time or use the roster import. Check each student's name and email before grading.

Roster and criteria

☒ Aiko Tanaka

☒ Haru Sato

☒ Mei Suzuki

A

B

C

D

The class setup fields and roster appear before grading

Criteria A-D are already built in. You choose the criterion when you create an assignment, and every score stays visible in Window 2.

Add an assignment and enter marks

1. Choose the class and term in the top bar.
2. In Window 1, click **Add assignment / exam**.
3. Enter a name and date, keep **Assignment** selected, choose Criterion A, B, C, or D, then click **Create**.
4. Select a student in Window 2. In Window 3, find the new assignment and enter a mark from 0 to 8. Add a short note if useful.
5. Repeat for the class. CAM saves changes to the gradebook; **Save now** is available for reassurance.

A new assignment shows as missing until you enter a mark or switch that assignment off.

Grade an exam

1. In Window 1, create a new item and choose **Exam**.
2. Open its analytics, then click **Exam setup**.
3. In the grading workspace, choose the folder of scanned PDFs. Add the question boxes and maximum marks, then click **Process All PDFs**.
4. Grade one question at a time across the class. Use the checklist and comment boxes as you work.
5. Click **Export CSV**. Return to CAM; the marks sync into the exam. Use CAM's exam grading panel to convert the raw total into the criterion grade.

Scan every paper in the same page order. If CAM warns that one script has a different page count, re-scan it before grading.

Reports and exports

1. Choose the class and term you want to report.
2. Review the final criterion grades and comments in Window 3.
3. Scroll to **System deliverables**.
4. Click **Build Excel master** for the multi-tab grade workbook, or **Build report-card pack** for one document containing every student's report.
5. When the download button appears, click it and save the file. Select one student first if you only need that student's report.

System deliverables

Active class: Year 8 Art

Build Excel master

XLSX

Build report-card pack

DOCX

After CAM finishes building

Download the file

Choose where to save it

Build the class export, then use the download button that appears

Exports cover the active class only. If files are still waiting in staging, commit them before building reports.

Back up your term

1. Open **Settings** and find **Term backup and restore**.
2. Beside **Backup folder**, click **Browse...** and choose a folder outside your CAM data folder.
3. Choose the term, then click **Back up term**.
4. Read the success message and confirm the backup file is in the folder you chose.

Back up term

Outside CAM Data

Choose an outside backup folder, select the term, and make the snapshot

Keep a second copy on a USB drive or another safe device. Eject a USB drive properly after the backup finishes. Never delete CAM's existing `.bak-*` files.

When something goes wrong

CAM will not start

Double-click **Start CAM (troubleshooting).bat**. Leave the black window open and read the latest message. The same details are saved in `logs\cam.log`. If port 8600 is already in use, close the other CAM window and try again.

CAM cannot find your gradebook

On the welcome screen, click **Browse...** and choose the folder containing `acm_database.json`. If CAM is already open, use **Settings - Custom Database Path**. Load the existing database when CAM shows its class and student counts; do not choose Replace unless you truly mean to overwrite it.

You moved to a new laptop

Extract a fresh CAM bundle. Copy or connect your existing data folder, start CAM, and point **Browse...** at that folder. Do not copy `local_device_prefs.json`; each computer keeps its own paths.

Start CAM
(troubleshooting).bat

CAM will not start

Run the visible launcher.
Leave its window open.

logs\cam.log

Read the latest clue

Close another CAM window
if port 8600 is busy.

Existing CAM Data

Reconnect your data

Use Browse... and load
the existing database.

Use the troubleshooting launcher, find the log, or reconnect the existing data folder
